CAPSTONE PROJECT REPORT FACE DETECTION AND RECOGNITION

NAME: DHIVAKAR.R

COURSE: AI and ML Aug 2020 Batch

Problem Statement:

Build a machine learning model for Face Detection and Recognition

Prerequisites

Prerequisites: Python 3.6: This setup requires that your machine has latest version of python. The following url https://www.python.org/downloads/ can be referred to download python. Once you have python downloaded and installed, you will need to setup PATH variables (if you want to run python program directly, detail instructions are below in how to run software section). To do that check this: https://www.pythoncentral.io/ add-python-to-path-python-is-not-recognized-as-an-internal-or-external command/. Setting up PATH variable is optional as you can also run program without it and more instruction are given below on this topic.

Anaconda: Download anaconda and use its anaconda prompt to run the commands. To install anaconda check this url https://www.anaconda.com/download/ You will also need to download and install below 3 packages after you install either python or anaconda from the steps above Sklearn (scikit-learn) numpy scipy if you have chosen to install python 3.6 then run below commands in command prompt/terminal to install these packages pip install -U scikit-learn pip install numpy pip install scipy if you have chosen to install anaconda then run below commands in anaconda prompt to install these packages conda install -c scikit learn conda install -c anaconda numpy conda install -c anaconda scipy

Dataset Used:

The data source used for this project is captured from live images using opency module. The screenshot of the process is shared

Implementation

Importing the Required libraries

Transforming the dataset:

Creating a Face Dataset

```
Creating data for face detection

def mark_images(f):
    ex = -1
    img = cv2.resize(cv2.imread(f), (640, 480))
    gray = cv2.cvtColor(img, cv2.ColoR.g6x2C6XV)
    face_detector = cv2.Cascadeclassifier(cv2.data.haarcascades + 'haarcascade_frontalface_default.xml')
    faces = face_detector.detectMultiscale(gray, 1.3, 5)
    for (x,y,w,h) in faces:
        cv2.restangle(img, (x,y), (x:w,y+h), (255,0,0), 2)
    plt.imshow(gray[y;y+h,x:x+w])
    plt.show()
    face_id = input('\n Assign an ID number and press enter ')
        in = np.expand_dims(np.expand_dims(gray[y;y+h,x:x+w], 0), 3)
    datagen.fit(im)
    for x, val in zip(datagen.flow(im, save_to_dir='C:\Users\\dhiva\\Desktop\\capstone\\face\\dataset', save_prefix="User_" + str(face_id), save_format='jpg'),range(100))
        ex = 1
```

Capturing the face data:
